

# Convolutional kernel

---

Paolo Burgio

paolo.burgio@unimore.it

# Matrix Convolution

- › Local operator (as opposite to «punctual» operator)
  - Gets a subset of input ~~matrix~~ image **A** to produce a pixel
- › Kernel of size **KxK** is shifted over image.
  - (Typically, smaller, e.g., 3x3, 5x5, 7x7)
  - For every pixel (x, y) of input image **A**
  - Multiply-accumulate **KxK** neighborhood

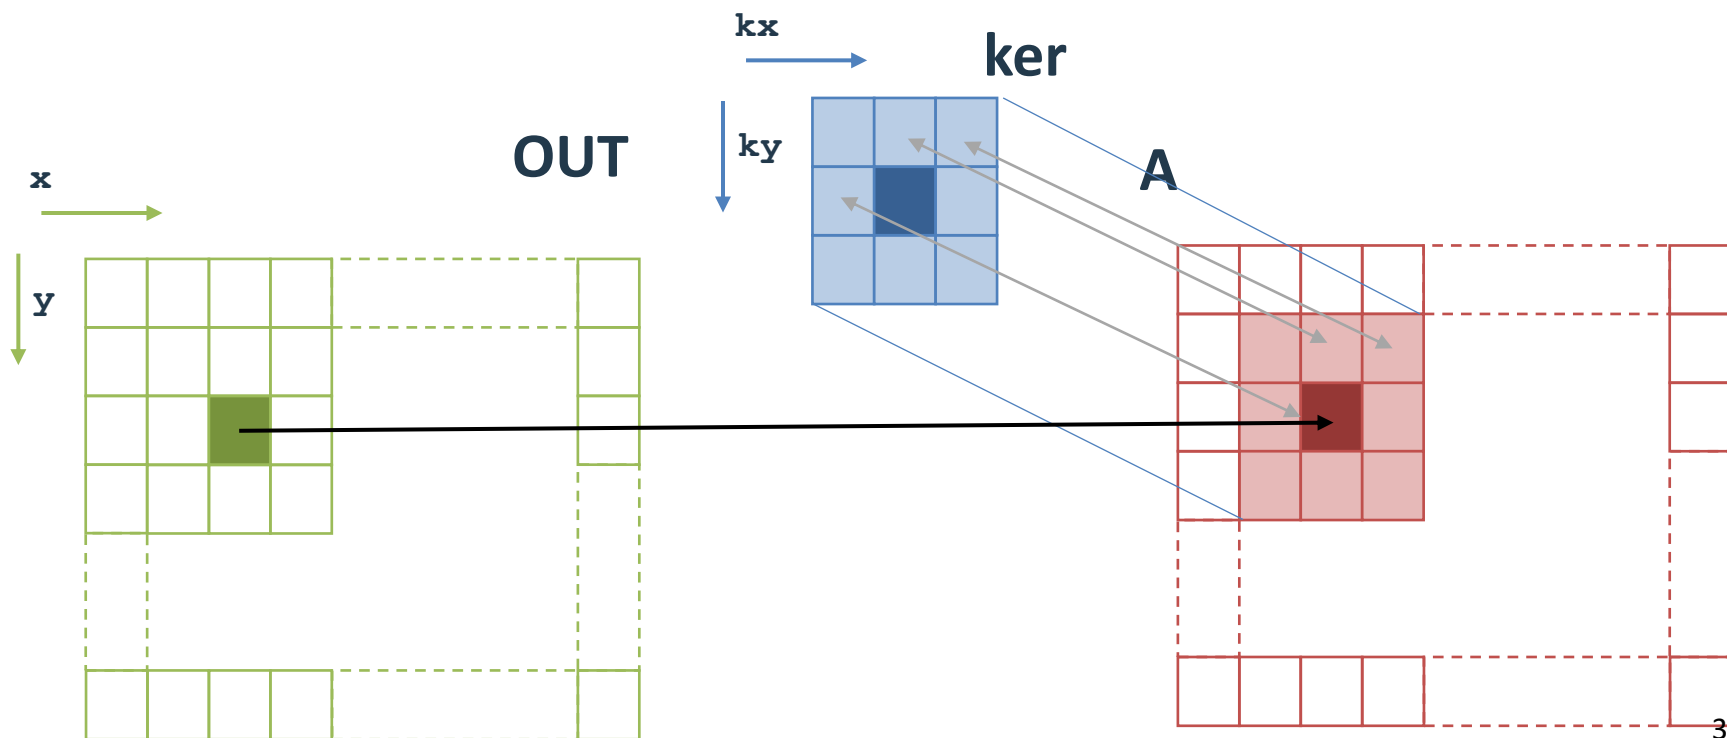

# Matrix Convolution

Four nested loops

- ›  $\mathbf{x}, \mathbf{y}$  to iterate over input/output matrices/images
- ›  $\mathbf{kx}, \mathbf{ky}$  to iterate over kernel  $\mathbf{K}$
- › Mind the borders!!!

# Matrix Convolution

---

Widely used in computer vision

Operation performed, varies with *ker*

- › Blur, feature detection, edge detection...
- › Convolutional neural networks for Artificial Intelligence

# Image blur with gaussian kernel

Kernel shape is controlled by the  $\sigma$  (*Sigma*) value

Algorithm knobs

- › Kernel dimension
- › Value of  $\sigma$

Kernels contain `float`

- › Typically, use normalized kernels (we will see this in a while)

# Quiz time!

---

- › Q1: what is the invariant kernel of convolution?
- › Q2: what do these two kernels do?

0	0	0
0	2	0
0	0	0

$1/9$	$1/9$	$1/9$
$1/9$	$1/9$	$1/9$
$1/9$	$1/9$	$1/9$

- › Q3: how do size of gaussian influence output?
- › Q4: what is the complexity of the 2D-convolution operator?

# Exercise

---

Let's  
code!

Implement a Gaussian filter, then parallelize it!

Starting from the code in `Lena/` folder

- › `imgutils` lib loads and stores a bmp image to/from an array of `uchar`
- › Atm, only Grayscale images
- › `template.c` as starting point

# Who is Lena?

---

- › Image historically used by CV engineers
- › Both in Color and B/W, full of contrasts, details, ...
- › ...and she's hot (charged of sexism)
